# Smoke takes your breath away

The greatest danger of a fire is getting into difficulty breathing. There are few burns and deaths caused by fire, and **80% of the dead are dying due to suffocation**. Fire smoke contains toxic gases such as carbon monoxide. **By inhaling toxic smoke, the danger of death will be much higher.**

In the event of a fire, various toxic gases, smoke and flames hinder fire fighting activities and **the staff's body is placed in a very dangerous situation**. If the initial fire fighting activity can not be carried out safely, in the worst case it may lead to death accident. In case of casualties are put out, **there is a possibility that the manager in charge will pursue negligence.**

**Which anti-smoking / smoke mask is a good product?** Unfortunately, there seems to be some malignant products that display false indications that there is removal performance despite being unable to remove toxic components. According to the criteria of the Fire and Disaster Management Agency of Japan's Ministry of Internal Affairs and Communications, performance to eliminate toxic gases under the conditions of white smoke and black smoke is required. **This is the toughest standard in the world.**
